Abstracts

Polished bore receptacles, or PBRs, are a common item in completion assemblies and liner hanger assemblies. The casing design and tubular movement programs help determine the length of sealing assembly needed for casing tie-back seals and tubing seals. As completion designs get more complicated, and more reservoirs are completed at one time to reduce capital cost, proper zonal isolation becomes more critical. PBRs are one way of engineering zonal isolation by providing a receptacle for seal assemblies of any length. A growing trend in critical completions is the need for longer-length PBRs. Some deepwater Gulf of Mexico completions have been requiring 50+ ft long PBRs for producing wells, and 100+ ft long PBRs for water injection wells. This helps facilitate expected tube movement under changing life-of-well conditions. In today's cost-focused market, it is also becoming more important to reduce workover and intervention costs. When planned future zone change workovers, or unplanned tubing string replacements are needed, PBRs can help reduce the mechanical risk and cost of such future workovers. The PBR assembly protects the packer bore itself and in many cases eliminates the need to retrieve (or possibly fish) the production packer. This in turn reduces workover time duration and cost. As the requirement for longer lengths grows, it is important to note the value obtained from longer-length PBRs.

The global Polished Bore Receptacles (PBR) market size was estimated at USD 73.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
