Abstracts

Polyacrylamide (PAM) is a water-soluble polymer formed from acrylamide subunits. It is known for its ability to enhance the viscosity of water, facilitate flocculation, and modify fluid flow characteristics. The polymer exists in various forms, including anionic, cationic, non-ionic, and amphoteric polyacrylamide, each designed for specific applications.

Anionic Polyacrylamide (APAM): This variant is primarily used in wastewater treatment, enhanced oil recovery, and paper manufacturing due to its superior flocculating capabilities. It helps in the aggregation of suspended particles, thereby improving solid-liquid separation.

Cationic Polyacrylamide (CPAM): This type is widely utilized in sludge dewatering, municipal wastewater treatment, and in the paper and textile industries. CPAM works effectively in acidic conditions and aids in the reduction of sludge volume.

Non-Ionic Polyacrylamide (NPAM): With no charge in its molecular structure, NPAM is suitable for applications where ion interaction must be minimized. It is commonly used in mining, textile processing, and water treatment.

Amphoteric Polyacrylamide: Containing both anionic and cationic groups, this type of PAM is used in complex wastewater treatment processes and in cases requiring adaptive flocculation performance.

PAM is synthesized through free radical polymerization of acrylamide monomers, often with additional functional groups incorporated to tailor its properties. The polymer's primary applications leverage its water absorption, thickening, and coagulating properties, making it indispensable across various industries. Polyacrylamide is widely used as a retention agent, filter aid, uniformity agent, water treatment agent, etc. in the field of papermaking. Its function is to improve the quality of paper, improve the dehydration performance of pulp, increase the retention rate of fine fibers and fillers, reduce the consumption of raw materials and pollution to the environment, etc. The effect of using it in papermaking depends on its average molecular weight, ionic properties, ionic strength and the activity of other copolymers. Non-ionic PAM is mainly used to improve the filterability of pulp, increase

the strength of dry paper, and increase the retention rate of fibers and fillers; anionic copolymers are mainly used as dry and wet enhancers and retention agents for paper; cationic copolymers are mainly used for papermaking wastewater treatment and filter aid, and also have a good effect on improving the retention rate of fillers. The polyacrylamide market is expected to continue growing, driven by increasing demand in Papermaking industry. Manufacturers are focusing on sustainable formulations, reducing environmental impact, and improving product efficiency. Research into biodegradable and non-toxic alternatives to traditional polyacrylamide is ongoing, which may lead to new product developments in the coming years. Polyacrylamide is used as a retention aid, drainage aid, and flocculant in paper manufacturing. The expansion of e-commerce and packaging industries has fueled the demand for paper products, thereby driving the need for PAM. The global key manufacturers of Papermaking Polyacrylamide include SNF Group, Solenis and Kemira, etc, top 3 manufacturers hold a share approximately 60%. SNF Group is the world's largest Papermaking Polyacrylamide manufacturer, with a market share of more than 40%.
