## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyacrylamide Electrophoresis Microspheres competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of polyacrylamide electrophoresis microspheres will reach 288 kg, with an average selling price of \$236/gram. Polyacrylamide electrophoresis microspheres are micron-sized functional particles made from polyacrylamide (PAM) through processes such as emulsion polymerization, suspension polymerization, or cross-linking. They are specifically designed to serve as separation media or functional carriers in electrophoresis technology. The amide groups (-CONH<sub>2</sub>) in the molecular chain form a three-dimensional network structure through hydrogen bonding, which can control the migration behavior of biomacromolecules (such as proteins and nucleic acids) under electric fields, achieving efficient separation. Furthermore, the microsphere surface can be modified with functional groups (such as carboxyl and amino groups) for specific adsorption or labeling of target molecules, playing a key role in proteomics, clinical diagnostics, and environmental analysis.

The global Polyacrylamide Electrophoresis Microspheres market size was estimated at USD 67.88 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
