Abstracts

Polyacrylamide potassium salt used in drilling fluid is a commonly used polymer in oil and gas drilling. It is mainly used in drilling fluids to help improve drilling efficiency and enhance the performance of drilling fluids. Polyacrylamide potassium salt, as a high molecular weight thickener, can increase the viscosity of drilling fluid, making it have better bearing capacity and the ability to carry cutting materials. This is crucial for maintaining the fluidity of drilling fluid and avoiding blockages. Polyacrylamide potassium salt can effectively reduce water infiltration in drilling fluid and enhance the stability of drilling fluid. This helps prevent drilling fluid from losing water, reduce the contact between drilling fluid and the formation, and minimize the impact on the formation.

The global Polyacrylamide Potassium Salt for Drilling Fluid market size was estimated at USD 236.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
