## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyaluminium Chloride Powder competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Polyaluminium Chloride Powder production reached approximately 4,226.4 K tons, with an average global market price of around 285.3 USD/ton. Polyaluminium Chloride (PAC) Powder is an efficient inorganic polymer flocculant with the chemical formula  $(Al_n(OH)_mCl_{3-n})_x$  (where  $n=1-5$ ,  $m \geq 10$ ), appearing as yellow, tawny, or white dry powder or granular form. It is produced through processes such as polymerization, concentration, and drying using raw materials like bauxite, aluminum hydroxide, or aluminum-containing industrial by-products, featuring high positive charge density in its molecular structure. By mechanisms of charge neutralization, adsorption bridging, and precipitation netting, it can rapidly agglomerate suspended solids, colloids, organic matter, and partial heavy metal ions in water into flocs for easy separation, with advantages of fast dissolution, low dosage, wide applicable pH range, and minimal sludge production compared to traditional aluminum salts. It complies with relevant water treatment chemical standards and serves as a core material for water purification and wastewater treatment. Market demand for Polyaluminium Chloride Powder is driven by the global emphasis on environmental protection, the expansion and upgrading of municipal sewage treatment facilities, the stricter wastewater discharge standards in industries such as papermaking, printing and dyeing, and mining, as well as the growing demand for drinking water purification. Business opportunities lie in developing high-purity products with low heavy metal content to meet the needs of high-end fields such as electronic-grade water treatment and food industry; exploring green production processes using aluminum-containing industrial by-products (e.g., red mud, aluminum ash) to reduce costs and align with

circular economy policies; and expanding into emerging markets with increasing water treatment needs, while enhancing product competitiveness through technological upgrades to address trade barriers and meet differentiated application requirements in various wastewater treatment scenarios.

The global Polyaluminium Chloride Powder market size was estimated at USD 1206.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.70% during the forecast period.
