Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyaminocarboxylic Acids competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyaminocarboxylic acids are a class of organic compounds that contain multiple amine groups (-NH₂) and carboxylic acid groups (-COOH) within the same molecule. These compounds are known for their strong metal-chelating properties, meaning they can bind to metal ions through coordination bonds, forming stable complexes. The most well-known polyaminocarboxylic acid is ethylenediaminetetraacetic acid (EDTA), widely used in industrial, medical, and environmental applications to sequester metal ions. Structurally, polyaminocarboxylic acids typically have a central amine backbone with attached carboxyl groups, allowing them to act as multidentate ligands in chelation processes. Polyaminocarboxylic acids are multifunctional organic compounds characterized by the presence of multiple amine (-NH₂) and carboxylic acid (-COOH) groups, enabling them to act as strong chelating agents for metal ions. Key parameters include a high number of donor atoms (typically 4-8), high water solubility (especially in salt form), and strong metal-binding stability constants (log K values often >10 for divalent metals like Ca²⁺ and Cu²⁺). These compounds, such as EDTA and DTPA, exhibit pK_a values ranging from 1.5 to 11.0, allowing them to function effectively across a wide pH range. Their molecular weights vary based on structure, with EDTA being 292.24 g/mol. While generally thermally stable and non-hygroscopic, traditional polyaminocarboxylic acids like EDTA are poorly biodegradable, prompting the development of more environmentally friendly variants like MGDA and NTA. Their metal ion selectivity, coordination geometry, and physicochemical properties make them indispensable in water treatment, medicine, agriculture, and industrial cleaning.

The global Polyaminocarboxylic Acids market size was estimated at USD 2438.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
