Report Overview

Polycarbodiimide crosslinker is a yellowish transparent liquid that can improve adhesion to special substrates. Polycarbodiimide can be used as a room temperature crosslinker for carboxylic acid-type waterborne polyurethanes, etc., and can be stably present in PU emulsions. Its crosslinking reaction is carried out by acid catalysis. During the drying process of the coating, the pH value in the film decreases due to the volatilization of water and neutralizers, providing conditions for the occurrence of crosslinking reactions. The dosage is generally 5%-10%, and there are also less, and the applicable period is about 12 hours. Compared with aziridine crosslinkers, it does not affect yellowing. Ordinary carbodiimide crosslinkers are difficult to disperse in water, and can be modified with PEG to make them easy to disperse.

This report provides a deep insight into the global Polycarbodiimide Crosslinker market covering all its essential aspects.
