Abstracts

Notable for its excellent impact resistance — 50 times greater than acrylic — and durability against weather elements, polycarbonate is self-extinguishing and boasts high transparency. However, it is susceptible to stress corrosion from organic solvents, which restricts the use of solvent-based adhesives, and its surface is prone to scratching. Polycarbonate machining is pivotal in producing components that metals cannot easily create, including various cutting, shaping, bending, and welding applications. Despite its hardness, which presents both advantages and challenges during machining, ensuring smooth, chamfered edges post-cutting is crucial to avoid sharpness. Utilized for its transparency, machined polycarbonate products include eyeglass lenses, smartphone cases, and clear partitions.

The global Polycarbonate Machining Service market size was estimated at USD 751.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
