Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polycrystalline Silicon Thin Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polycrystalline Silicon Thin Film is a semiconductor material composed of multiple small silicon crystals deposited onto a substrate such as glass, quartz, or metal foil, typically via chemical vapor deposition (CVD) or plasma-enhanced CVD processes. It serves as the active layer in thin-film transistors (TFTs), solar cells, and display backplanes, offering higher carrier mobility and thermal stability than amorphous silicon. The supply chain begins with raw materials like metallurgical-grade silicon, which are refined into high-purity polysilicon feedstock. This feedstock is then deposited into thin films, followed by annealing and crystallization (using laser or thermal methods) to control grain size and uniformity. Downstream, the films are integrated into semiconductor devices and photovoltaic modules through photolithography, doping, and encapsulation steps. Major downstream industries include solar photovoltaics, flat-panel displays, and semiconductor electronics. In 2024, global Polycrystalline Silicon Thin Film output was about 12,500 tons, with a capacity near 15,000 tons. Prices ranged from USD 75,000-260,000 per ton depending on purity and process, and the market maintained an average gross margin of 38%.

The global Polycrystalline Silicon Thin Film market size was estimated at USD 1257.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
