Abstracts

Polycrystalline texturing additive is a key adjuvant used in the surface treatment of polycrystalline silicon wafers. Added to the etching solution during the polycrystalline texturing process, it modifies the rate and direction of the etching reaction. This suppresses the etching differences among silicon with different crystal orientations, creating a more uniform textured surface. As a result, it significantly improves the light-trapping ability of polycrystalline silicon wafers, enhancing the efficiency of polycrystalline silicon solar cells in the photovoltaic manufacturing industry.

The global Polycrystalline Texturing Additive market size was estimated at USD 56.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
