Abstracts

Polycythemia vera (PV) drugs are pharmaceutical agents specifically developed to manage and treat polycythemia vera, a rare, chronic myeloproliferative neoplasm characterized by the overproduction of red blood cells, white blood cells, and platelets in the bone marrow, leading to an increased risk of thrombosis, bleeding, and potential progression to myelofibrosis or acute leukemia. These therapeutics include hydroxyurea as a first-line cytoreductive agent, interferon alfa preparations (such as ropeginterferon alfa-2b) for patients intolerant to or unsuitable for hydroxyurea, and JAK inhibitors like ruxolitinib for cases with symptomatic splenomegaly or inadequate response to prior therapies, with treatment strategies focusing on controlling hematocrit levels, minimizing thrombotic events, alleviating disease-related symptoms, and delaying disease progression. The market for these drugs is shaped by the rarity of the condition, necessitating specialized diagnostic and treatment protocols, ongoing clinical research into novel targeted therapies, and the critical need to address both hematological parameters and quality-of-life concerns for affected patients.

The global Polycythemia Vera Drug market size was estimated at USD 850.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
