Report Overview

Polydioxanone Suture, commonly known as PDS, is a type of synthetic absorbable suture material used in surgical procedures. It is made from a polymer of p-dioxanone, which provides a combination of strength, flexibility, and biocompatibility. PDS sutures are designed to maintain their tensile strength for an extended period, typically around 4-6 weeks, allowing for adequate wound support during the healing process. They are gradually absorbed by the body through hydrolysis, eliminating the need for suture removal. PDS sutures are often used in various surgical applications, including closure of fascia, soft tissues, and in orthopedic and cardiovascular surgeries due to their excellent handling properties and minimal tissue reactivity.
