Abstracts

Polyester matting agents are specialized chemical additives used to reduce the gloss and create a matte or satin finish on polyester-based surfaces, primarily in coatings, textiles, and plastics industries. These agents, often composed of inorganic particles like silica or organic wax dispersions, work by introducing micro-roughness on the surface, which scatters incident light and diminishes reflective properties. Their formulation is tailored to ensure compatibility with polyester resins, providing uniform dispersion, stability, and durability without compromising mechanical properties such as adhesion, scratch resistance, or weatherability. The effectiveness of a matting agent is measured by its ability to achieve target gloss levels (e.g., 60° gloss values below 10 units) while maintaining clarity, smooth texture, and minimal impact on viscosity or application performance.

The global Polyester Matting Agent market size was estimated at USD 290.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
