Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyester Nonwoven Fabric (RO Membrane Substrate) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Reverse osmosis membrane is the core component for achieving reverse osmosis. It is an artificial semipermeable membrane with corresponding characteristics made by simulating biological semipermeable membrane. Reverse osmosis membrane is composed of three layers of different materials, namely polyester non-woven fabric (skeleton support layer), polysulfone layer (loose support layer), and aromatic polyamide (reverse osmosis layer). As the supporting substrate, the mechanical properties of polyester non-woven fabric determine the mechanical properties of reverse osmosis membrane; its surface roughness determines the bonding force between polysulfone layer and non-woven fabric; its average pore size also has an important influence on the size of water flux, thus affecting its use effect. It is one of the core components of reverse osmosis membrane.

The global Polyester Nonwoven Fabric (RO Membrane Substrate) market size was estimated at USD 468.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
