Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyether-Modified Polydimethylsiloxane competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyether-modified polydimethylsiloxane is an organosilicon nonionic surfactant obtained by grafting polyether segments onto polydimethylsiloxane macromolecules. It combines the silky feel of polydimethylsiloxane with the water solubility of polyether, thus being soluble in both water and oil, exhibiting excellent compatibility. The upstream of the polyether-modified polydimethylsiloxane industry chain mainly includes organosilicon monomers (such as dimethyldichlorosilane) and polyether polyols (such as polyoxyethylene alcohol and polyoxypropylene alcohol). Silicon monomers are hydrolyzed and condensed to form the polydimethylsiloxane backbone, which is then introduced into the polyether chain via grafting or addition reactions to form the target product. Polyether-modified polysiloxanes are mainly used in personal care products (such as shampoos, conditioners, skincare products, and shaving creams) and the textile/leather industry (such as softeners, water-repellent agents, lubricants, and antistatic agents). Global sales volume in 2024 was approximately 80,000 tons, with an average market price of approximately US\$6,000 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, typically ranging from 2,000 to 5,000 tons per year, with industry gross profit margins ranging from 15% to 25%.

The global Polyether-Modified Polydimethylsiloxane market size was estimated at USD 480.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
