Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Poly(ethylene glycol)-b-poly lactide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Poly(ethylene glycol)-b-poly lactide (PEG-b-PLA) reached approximately 500 tons, with an average global market price of around USD 240 per kg. Poly(ethylene glycol)-b-poly lactide (PEG-b-PLA) is an amphiphilic block copolymer consisting of a hydrophilic poly(ethylene glycol) (PEG) segment and a hydrophobic polylactide (PLA) segment, typically linked through covalent bonds. PEG provides water solubility and biocompatibility, while PLA offers biodegradability and hydrophobic characteristics. This copolymer is synthesized via ring-opening polymerization of lactide monomers onto hydroxyl-terminated PEG chains, allowing control over block lengths and molecular weights. Due to its amphiphilic nature, PEG-b-PLA can self-assemble into micelles, vesicles, and nanoparticles in aqueous environments, making it valuable in drug delivery, tissue engineering, biomedical coatings, and controlled-release systems. Both PEG and PLA are FDA-approved components, enhancing the material's suitability for medical and pharmaceutical applications.

The global Poly(ethylene glycol)-b-poly lactide market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
