Abstracts

Polyethylene Glycol Ester (PEG ester) is a class of synthetic, nonionic surfactants and emulsifiers derived from the esterification of polyethylene glycol (PEG) with fatty acids, which yields compounds characterized by both hydrophilic (PEG chain) and lipophilic (fatty acid chain) properties. This amphiphilic structure enables PEG esters to reduce surface tension, stabilize emulsions, enhance solubility, and improve wetting and dispersibility across various formulations. Depending on the molecular weight of the PEG segment and the type of fatty acid used (e.g., stearic, oleic, or lauric acid), PEG esters can range from liquid to solid forms and exhibit varying hydrophilic-lipophilic balance (HLB) values, making them highly versatile in tailoring performance for specific applications. They are biodegradable, generally recognized as safe for many uses, and compatible with a wide range of ingredients, which underpins their utility in industries such as pharmaceuticals, cosmetics, food processing, agrochemicals, and industrial manufacturing.

The global Polyethylene Glycol Ester market size was estimated at USD 2454.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
