Report Overview:

Polyethylene vapour control layer (VCL) is a type of building membrane used to control the movement of water vapour within a building envelope. It is typically made of polyethylene, a durable and flexible plastic material.

The main purpose of a polyethylene VCL is to prevent the passage of water vapour from the warm, moist interior of a building to the cooler, drier exterior. By doing so, it helps to reduce the risk of condensation forming within the building structure, which can lead to dampness, mold growth, and structural damage.

The Global Polyethylene Vapour Control Layer Market Size was estimated at USD 1299.70 million in 2023 and is projected to reach USD 1833.24 million by 2029, exhibiting a CAGR of 5.90% during the forecast period.
