Report Overview:

Polyglycolide or poly(glycolic acid) (PGA), also spelled as polyglycolic acid is a biodegradable, semi-crystalline thermoplastic. It is also the simplest linear, aliphatic polyester. PGA resins are known for their excellent gas barrier properties, relative high strength, and excellent biodegradability. Some grades have a biodegradation rate similar to cellulose and decompose under composting conditions into CO₂ and water within one month.

PGA and its copolymers such as poly(lactic-co-glycolic acid), and poly(glycolide-co-caprolactone) are used in a number of applications. Due to PGA's very low permeability to O₂ and CO₂, it can be used as a packaging film for oxygen sensitive products, for example as an interlayer between two polyester films. Other important applications include shale gas extraction and other industrial processes as well as synthetic fast absorbable sutures for internal surgeries.

The Global Polyglycolic Acid Market Size was estimated at USD 118.25 million in 2023 and is projected to reach USD 427.80 million by 2029, exhibiting a CAGR of 23.90% during the forecast period.
