The laser emits a beam that is directed onto a photoreceptor or imaging surface. The laser beam is directed onto a set of flat mirrors attached to a polygonal (multi-faceted) mirror. The polygon mirror is typically a small, multi-faceted assembly that is rotated at high speed by a polygonal scanner motor. This motor rotates the polygon mirror at a constant speed (sometimes varying speeds depending on the design) so that each facet reflects the laser beam in a precise pattern. As the motor rotates the polygon mirror, the laser beam reflects off its various faces and strikes the imaging drum or belt. This scanning process typically writes the document or image to the photoreceptor line by line. The laser beam is modulated by a controller, turning it on, off, or varying its intensity to create an image. The rapid rotation of the polygon mirror ensures that the laser scans the entire surface quickly and evenly, typically in a raster pattern.

The global Polygon Mirror Scanner Motor market size was estimated at USD 53.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
