Abstracts

Polyimide Bearing Cage is an important component for bearings made of polyimide material. Polyimide has many excellent properties, such as light weight, high strength, good self-lubrication, wear resistance, and good chemical stability. During the operation of the bearing, the key function of this cage is to precisely and evenly separate the rolling elements (such as balls and rollers), preventing the rolling elements from contacting and rubbing against each other, and ensuring that the rolling elements can roll smoothly and stably inside the bearing. Thanks to the advantages of the polyimide material, the polyimide bearing cage can effectively reduce the noise and vibration generated during the operation of the bearing, improve the running accuracy and efficiency of the bearing, and can also adapt to relatively harsh working conditions such as high-speed and high-temperature environments. It is widely used in fields with extremely high requirements for bearing performance, such as aerospace, high-speed machine tools, and precision instruments.

The global Polyimide Bearing Cage market size was estimated at USD 315.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
