The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyimide Orientation Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyimide (PI) orientation agents are advanced chemical materials used primarily in the alignment layers of liquid crystal displays (LCDs). These agents help control the orientation of liquid crystal molecules by forming a uniform thin film on the inner surfaces of display panels. Depending on the method of alignment, PI orientation agents can be categorized into types suitable for friction (rubbing) alignment and photo-alignment techniques. Their thermal stability, chemical resistance, and excellent electrical insulation make them critical in ensuring precise molecular alignment, thereby improving display quality, response time, and viewing angles. PI orientation agents are indispensable in producing high-resolution and high-reliability display technologies. Market Trends and Domestic Substitution Potential As China advances toward self-sufficiency and innovation in high-end manufacturing, PI orientation agents have emerged as a strategically important material in the display panel industry. The growing demand for advanced displays in TFT LCDs, high-definition monitors, and other flat-panel technologies has opened significant opportunities for domestic substitution of imported materials. Local manufacturers are increasingly investing in the research and production of high-performance PI orientation agents to reduce reliance on foreign suppliers. This trend not only supports national industrial policy goals but also enables Chinese enterprises to strengthen their global market positions by offering competitive and technologically advanced solutions. Technological Development and Application Expansion The evolution of display technologies, driven by 5G, consumer electronics, smart devices, and electric vehicles, is accelerating the demand for more efficient and specialized PI orientation agents. Photo-alignment

technologies such as IPS/FFS (Optical Alignment) and VA:PSA, which rely on UV exposure rather than mechanical rubbing, are gaining popularity for their ability to reduce surface defects and contamination. Meanwhile, traditional rubbing alignment methods remain in use due to their cost-effectiveness and proven reliability. These dual trends are fostering innovation in the PI orientation agent market, encouraging large-scale production and the diversification of applications. With continued advancements, PI orientation agents are expected to play an increasingly critical role in next-generation display technologies globally.

The global Polyimide Orientation Agent market size was estimated at USD 673.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
