Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Poly(m-xylylene Adipamide) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Poly(m-xylylene adipamide), commonly known as MXD6, is a semi-aromatic crystalline polyamide produced by the polycondensation of m-xylylenediamine (MXDA) and adipic acid. It is known for its exceptional gas barrier properties against oxygen and carbon dioxide, high mechanical strength and rigidity, and good dimensional stability. However, MXD6 has a low flame retardancy, requiring modifications to meet safety standards for certain applications. In 2024, global Poly(m-xylylene Adipamide) production reached approximately 43 k tons, with an average global market price of around US\$9500 per ton. The typical single-line production capacity for this product is approximately 3,000-8,000 tons/year, with leading companies reaching tens of thousands of tons. The industry's gross profit margin is approximately 15%-25%. Raw materials account for the largest portion of costs (70-80%), followed by energy, labor, and depreciation, each accounting for approximately 20%-30%. The main upstream raw materials for this product are meta-xylylene diamine (MXDA) and adipic acid. Its downstream applications include food and beverage packaging bottles (oxygen barrier layers), films, barrier nylon composites, automotive parts, and electronic and electrical components.

The global Poly(m-xylylene Adipamide) market size was estimated at USD 409.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
