Abstracts

Polymer dispersed liquid crystal (PDLC) color-changing glass is a new type of dimming glass material developed in the past decade. Its principle is that liquid crystal is dispersed in an organic solid polymer matrix in the form of micron-sized droplets. Since the optical axis of the small droplets composed of liquid crystal molecules is in a free orientation, its refractive index does not match the refractive index of the matrix. When light passes through the matrix, it is strongly scattered by the microdroplets and appears in an opaque milky white state or translucent state. Applying an electric field can adjust the optical axis orientation of the liquid crystal droplets. When the refractive indices of the two match, they will appear transparent. When the electric field is removed, the liquid crystal droplets return to their original astigmatism state, thereby displaying. The technology of PDLC color-changing glass is relatively mature and widely used. Currently, it is mostly used in construction of commercial places. In recent years, the energy conservation and environmental protection industry, with its huge industrial driving role, economic radiation effect and social ecological benefits, has increasingly become a new economic growth point that major developed countries in the world focus on cultivating and vigorously developing. Polymer dispersed liquid crystal smart glass can reduce the energy requirements for heating and cooling in buildings equipped with color-changing glass, which is in line with people's pursuit of technical and environmental protection.

The global Polymer Dispersed Liquid Crystal (PDLC) Smart Glass market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
