Abstracts

Polymer ligation clips are medical devices designed for the occlusion of blood vessels and ducts during surgical procedures. These clips are manufactured from biocompatible polymers, such as PEEK or absorbable materials, and function as an alternative to traditional metallic clips. They are applied using specialized clip appliers to securely close tubular structures, providing hemostasis or preventing leakage. Key characteristics include radiolucency, which eliminates artifact interference in postoperative imaging, and, in the case of absorbable variants, gradual degradation within the body over time. These features make polymer ligation clips particularly valuable in minimally invasive surgeries, including laparoscopic and robotic-assisted procedures, where clarity of imaging and reduced foreign body presence are prioritized.

The global Polymer Ligation Clips market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
