Report Overview:

A photostabilizer is also called light stabilizer or photoprotective agent. There are two types of light stabilizers. One is UV absorber which is to absorb harmful UV light to protect the coating. The other is hindered amine light stabilizer which is to capture free radicals to avoid coating degradation.

UV absorbers is to absorb UV light in competition with the chromophores which are part of the polymer backbone to prevent degradation. They are colorless or almost colorless additives, which have a strong absorbability in the ultraviolet part of the spectrum. UV absorbers can dissipate light energy as thermal energy.

Hindered Amine Light Stabilizers (HALS) is to capture free radicals before subsequent reactions leading to degradation can take place. HALS can impede thermo-oxidation. The polymer contains the HALS will still keep the resistance to photo-degradation even run of the HALS. The explanation for this phenomenon is that HALS' oxidation products, such as hydroxyl-amine and aminoether, can inhibit photo-degradation. Hydroxyl-amine and aminoether are all able to capture peroxide free radicals.

The Global Polymer Materials Photostabilizers Market Size was estimated at USD 1639.80 million in 2023 and is projected to reach USD 1890.56 million by 2029, exhibiting a CAGR of 2.40% during the forecast period.
