Abstracts

Polymer PTC thermistors (Positive Temperature Coefficient thermistors) are thermally sensitive resistors composed of conductive particles embedded within a polymer matrix, which exhibit a sharp, nonlinear increase in electrical resistance at a specific temperature threshold, known as the switching temperature. This self-regulating property makes them highly effective as resettable overcurrent protection devices, as they limit current flow during fault conditions (such as short circuits or overloads) by transitioning to a high-resistance state when heated, and then automatically reset to a low-resistance state once the fault is removed and the device cools. They are widely utilized across consumer electronics, automotive systems, industrial controls, and energy storage applications due to their reliability, compact form factor, and ability to provide repeated protection without replacement.

The global Polymer Ptc Thermister market size was estimated at USD 580.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
