Abstracts

Polymer resettable fuses are overcurrent protection devices based on polymer materials. When the current in the circuit exceeds the preset value, the self-resetting fuse will heat up quickly and its resistance value increases sharply, thus limiting the current passage and protecting the circuit from overcurrent damage. Once the fault is removed and the temperature drops, the self-resetting fuse will automatically return to a low resistance state and resume normal operation. Polymer recovery fuses provide reliable overcurrent protection for circuits, ensuring the safe and stable operation of equipment.

The global Polymer Resettable Fuses market size was estimated at USD 406.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
