Report Overview

Polymer thermistors are made of polymer materials filled with carbon black particles. This material has a certain conductivity, so it can pass the rated current. If the current passing through the thermistor is too high, its heating power is greater than the heat dissipation power. At this time, the temperature of the thermistor will start to rise continuously, and the polymer matrix in the thermistor will start to expand, which separates the carbon black particles and causes the resistance to rise, thus effectively reducing the current in the circuit.

This report provides a deep insight into the global Polymer Thermistor market covering all its essential aspects. This ranges from a macro overview of the market to micro details of the market size, competitive landscape, development trend, niche market, key market drivers and challenges, SWOT analysis, value chain analysis, etc.
