Abstracts

Polymeric phosphonates are a class of water-soluble polymers characterized by phosphonic acid functional groups along their backbone, designed to inhibit scale formation and corrosion in industrial water systems by sequestering metal ions and dispersing suspended solids. These compounds are engineered to offer superior thermal and hydrolytic stability compared to traditional phosphates and polyacrylates, making them particularly effective in high-temperature and high-pH environments such as cooling towers, boilers, reverse osmosis systems, and oilfield applications. Their mechanism involves threshold inhibition, where sub-stoichiometric concentrations prevent crystal growth and deposition, and they are often valued for their environmental profile, as many variants are biodegradable and exhibit low aquatic toxicity.

The global Polymeric Phosphonates market size was estimated at USD 210.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
