Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polymeric Toner competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Toner, scientifically known as electrostatic developer, is a powdery material that makes the electrostatic latent image a visible image during the development process. According to the different production methods, carbon powder can be divided into two categories - physical method carbon powder and polymeric toner. Among them, polymerized carbon powder has a small particle size and uniform distribution, and the effect is better than physical method carbon powder during printing, and it has gradually become a development trend. polymeric toner, also known as chemical carbon powder, is a powder particle formed by mixing solid resins, magnetic materials, pigments, charge regulators (CCA), wax and other additives, and then pelletizing, pulverizing and grading, surface modification, spheroidization treatment and other processes. It is different from physical carbon powder and has been widely used in the field of laser printing consumables. The advantages of chemical toner over physical toner are small particle size, uniform distribution, high resolution and excellent quality when printing. Polymeric toner has advantages that cannot be compared with physical toner in terms of printing efficiency and printing quality: from the perspective of single-box toner printing efficiency, polymerized toner waste powder rate is low; from the perspective of printing quality, polymerized toner has higher transfer rate, resolution and color reduction capabilities than physical toner, and has a lower fixing temperature, which is more suitable for the needs of color printing. The diversified development of modern printing has promoted the increase in the demand for color printing, and polymerized toner has small particle size, granular circle, uniform particle size distribution and lower fixing temperature, and is more suitable for the demand for color printing. Color polymerized

toner is also the main driving force supporting industry growth in the past few years.
