Report Overview:

Polymyxins are antibiotics, with a general structure consisting of a cyclic peptide with a long hydrophobic tail. They disrupt the structure of the bacterial cell membrane by interacting with its phospholipids. They are produced by nonribosomal peptide synthetase systems in Gram-positive bacteria such as *Paenibacillus polymyxa* and are selectively toxic for Gram-negative bacteria due to their specificity for the lipopolysaccharide molecule that exists within many Gram-negative outer membranes. At least eleven different members of the polymyxin group have been identified and they are designated by a suffix letter. They demonstrate specific activity against gram-negative bacteria such as *Proteus vulgaris*, *Escherichia coli*, *Hemophilus influenzae*, *Aerobacter aerogenes*, *Klebsiella pneumoniae* and especially *Pseudomonas aeruginosa*.

Polymyxins B and E (also known as colistin) are common types of polymyxins. Polymyxins B is used for the treatment of human Gram-negative bacterial infections, while polymyxins E is used for animal husbandry.

The Global Polymixin Market Size was estimated at USD 243.95 million in 2023 and is projected to reach USD 296.42 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
