Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polymyxin B competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Polymyxin B production reached approximately 3.76 thousand tons, with an average global market price of around US\$ 165,000 per ton. The gross profit margin of major producers ranges from 35% to 55%. Single-line production capacity typically ranges from 120 to 380 tons per year, depending on fermentation scale, purification capability, and bioreactor efficiency. Polymyxin B is a peptide-based antibiotic derived from *Paenibacillus polymyxa* and is known for strong activity against multidrug-resistant Gram-negative bacteria. It is widely used as a last-line therapy for severe infections caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. Due to its narrow therapeutic window, its API production requires high-purity fermentation, complex extraction, and strict quality control. The industrial chain includes upstream suppliers of fermentation media, amino acids, peptide precursors, bioreactor components, and pharmaceutical-grade solvents. Midstream manufacturers conduct microbial fermentation, extraction, chromatography purification, lyophilization, and sterile API packaging. Downstream users include injectable-drug manufacturers, hospital pharmacy networks, critical-care units, and anti-infective treatment centers.

The global Polymyxin B market size was estimated at USD 620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
