Abstracts

Polymyxin B Sulfate Active Pharmaceutical Ingredient (API) refers to the active pharmaceutical ingredient used to produce polymyxin B sulfate preparations and is the core active substance in the preparation. Its chemical name is polymyxin B sulfate, which belongs to the polypeptide antibiotics. It is prepared by fermentation process or chemical synthesis and is ultimately used to prepare injections, powder injections and other dosage forms. Polymyxin B sulfate API is the basic substance for the production of drugs against multidrug-resistant Gram-negative bacteria, and its quality directly affects the safety and effectiveness of the preparation. Through strict process control and quality standards, its reliable application as a "last line of defense" antibiotic in clinical practice can be ensured. The global increase in the infection rate of carbapenem-resistant Gram-negative bacteria (CRO), such as carbapenem-resistant *Klebsiella pneumoniae* (CRKP) and *Pseudomonas aeruginosa* (CRPA), has driven the demand for polymyxin B as a "last line of defense" antibiotic. The WHO lists polymyxins as core drugs for the treatment of multidrug-resistant bacterial infections, and the US IDSA guidelines also recommend their use in combination therapy. In addition, due to the abuse of antibiotics and differences in medical levels, the Asia-Pacific and Latin American regions have prominent problems with drug-resistant bacteria, making them the main regions for the growth of demand for polymyxin B sulfate API.

The global Polymyxin B Sulfate API market size was estimated at USD 192.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
