Abstracts

Polyolefin coated paper refers to a composite material consisting of a paper substrate that has been coated with a layer of polyolefin, such as polyethylene (PE) or polypropylene (PP), applied through extrusion or lamination processes. This coating enhances the paper's functional properties, including moisture resistance, grease resistance, durability, and barrier protection against external elements, making it suitable for applications where standard paper would be inadequate. The material is widely used in packaging—particularly for food items like fast food wrappers, bakery and confectionery packaging, and liquid container cartons—as well as in industrial applications such as labels, release liners, and protective wraps. Its versatility stems from the ability to tailor coating thickness, type of polyolefin, and base paper quality to meet specific performance requirements, balancing sustainability concerns with the need for product preservation and consumer safety.

The global Polyolefin Coated Paper market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
