Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyoxyethylene (23) Lauryl Ether competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyoxyethylene (23) Lauryl Ether is an ether compound derived from the polymerization of lauryl alcohol and ethylene oxide. It is a nonionic surfactant. It is highly hydrophilic, easily forms stable O/W (oil-in-water) emulsions, and is adept at dissolving fragrances and oil-phase ingredients. Its core upstream raw materials are lauryl alcohol (a C12 alcohol) and ethylene oxide (EO). Lauryl alcohol is typically derived from the fatty alcohol fraction of coconut oil/palm kernel oil or from petrochemical sources, while EO is produced through ethylene oxidation. Laureth-23 is primarily used in cosmetics and other personal care products, serving as a high HLB emulsifier and fragrance dissolver in creams, lotions, conditioners, and sunscreens. Global sales in 2024 are expected to be approximately 46,000 tons, with an average market price of approximately \$1,790 per ton. Single-line production capacity varies depending on the production process and investment in the production facility, typically ranging from 500 to 3,000 tons per year, with industry gross profit margins ranging from 15% to 27%.

The global Polyoxyethylene (23) Lauryl Ether market size was estimated at USD 82.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
