Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyoxyethylene-Polyoxypropylene Block Copolymer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyoxyethylene-Polyoxypropylene Block Copolymer (CAS 9003-11-6) is a nonionic polyether surfactant synthesized from ethylene oxide and propylene oxide through block polymerization. It possesses multiple functions including solubilization, detergency, emulsification, wetting, and defoaming, and is a biodegradable chemical substance. Its molecular structure is highly designable, allowing for different molecular weights and block lengths to achieve varying properties. Polyoxyethylene-Polyoxypropylene Block Copolymers are produced by first ring-opening polymerization of propylene oxide with propylene glycol as an initiator, followed by ring-opening polymerization of ethylene oxide. Propylene oxide is the most crucial raw material, accounting for the highest proportion of its production cost. The product has wide downstream applications, spanning industries such as manufacturing, agriculture, and pharmaceuticals. Global sales in 2024 were approximately 350,000 tons, with an average market price of approximately US\$2,300 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of the production equipment, typically ranging from 5,000 to 10,000 tons per year, with industry gross profit margins ranging from 12% to 30%. The global push for carbon neutrality and the implementation of related environmental regulations are driving the chemical industry towards a green and sustainable transformation. Compared to some traditional organic solvents, Polyoxyethylene-Polyoxypropylene Block Copolymers, as materials with better stability and biocompatibility, align with the trend towards environmentally friendly development. Currently, industry competition is

concentrated on low- to mid-range standardized products. Future development needs to focus on high-value-added products with functionalization and specialization. Companies need to deeply understand and master key technologies such as polymerization processes, molecular weight control, and the introduction of functional monomers.

The global Polyoxyethylene-Polyoxypropylene Block Copolymer market size was estimated at USD 805.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
