Report Overview

Polypectomy snares are medical devices used during endoscopic procedures to remove polyps from the gastrointestinal tract, primarily the colon. These snares consist of a thin, flexible wire loop that is advanced through an endoscope to encircle and excise polyps by applying an electrical current, a technique known as electrocautery. They are critical tools in both diagnostic and therapeutic settings, particularly in colorectal cancer screening programs, where early detection and removal of precancerous polyps can significantly reduce cancer incidence. The design of polypectomy snares varies, including differences in loop size, shape (oval, hexagonal, or crescent), and wire composition, allowing for customization based on polyp characteristics such as size, location, and morphology. Advanced versions may incorporate features like rotatable handles or insulated tips to enhance precision and safety during resection. As minimally invasive techniques gain prominence, polypectomy snares remain indispensable in gastroenterology, aligning with the growing emphasis on preventive healthcare and early intervention.
