Abstracts

Polyphthalamide (PPA) is a subset of thermoplastic synthetic resins in the polyamide (nylon) family defined as when 55% or more moles of the carboxylic acid portion of the repeating unit in the polymer chain is composed of a combination of terephthalic (TPA) and isophthalic (IPA) acids. PPA based resins are molded into parts to replace metals in applications requiring high temperature resistance such as automotive powertrain components, the housing for high temperature electrical connectors and many other uses. The base resin of PPA is generally modified by adding glass fiber, carbon fiber, minerals, and a combination of different materials to improve its properties. PPA resin has wide applications in under-the-bonnet automotive components, electrical and electronic devices such as LEDs, domestic appliances, and plastic components that are in contact with drinking water, in machinery parts, and in some personal care applications.

The global Polyphthalamide Resin market size was estimated at USD 2498.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
