Abstracts

Polypropylene copolymer (PPC) is a type of thermoplastic polymer produced by copolymerizing propylene with other monomers, such as ethylene, to enhance specific material properties not achievable with homopolymer polypropylene. This copolymerization process results in improved impact resistance, especially at low temperatures, greater flexibility, and better clarity, making PPC highly suitable for applications requiring durability and resilience. It is widely used across industries including automotive (for bumpers, interior trim, and battery cases), packaging (for transparent containers, lids, and films), consumer goods (such as housewares and appliances), and medical devices (like syringes and laboratory equipment), where a balance of toughness, chemical resistance, and processability is essential.

The global Polypropylene Copolymer market size was estimated at USD 78500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.25% during the forecast period.
