Abstracts

Polypropylene (PP) copolymer is a type of thermoplastic polymer derived from the polymerization of propylene monomers with one or more co-monomers, such as ethylene, resulting in a material that combines the rigidity and heat resistance of homopolymer PP with improved impact strength, clarity, and flexibility. Unlike PP homopolymer, which is more brittle at low temperatures, copolymers exhibit enhanced toughness and are better suited for applications requiring durability and resistance to stress cracking, making them ideal for use in automotive components, consumer goods packaging, household products, medical devices, and industrial applications where a balance of mechanical properties, chemical resistance, and processability is essential.

The global Polypropylene (Pp) Copolymer market size was estimated at USD 79350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
