Polysomnography (PSG) is a comprehensive sleep study used to diagnose sleep disorders by recording various physiological parameters during sleep. It typically involves the monitoring of brain activity through electroencephalography (EEG), eye movements via electrooculography (EOG), muscle activity through electromyography (EMG), and heart rhythm using electrocardiography (ECG). Additionally, it measures breathing patterns, oxygen levels in the blood, and body movements. PSG is usually conducted overnight in a sleep lab, where sensors are placed on the patient's body to collect data while they sleep.
