Report Overview

Polystyrene fluorescent microspheres are small, spherical particles made of polystyrene, a type of plastic, that are coated with fluorescent dyes. They are used in a variety of applications, including microscopy, flow cytometry, diagnostics, and as calibration standards. The fluorescent dyes are added to the polystyrene microspheres during the manufacturing process, and are chosen to emit a specific wavelength of light when excited by a light source. This makes them useful in applications where they can be used as markers or indicators, such as in biological imaging or environmental monitoring.

The global Polystyrene Fluorescent Microspheres market size was estimated at USD 285.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
