Abstracts

Polystyrene latex microparticles are spherical polymer beads with diameters typically ranging from 100 nanometers to several microns, produced through emulsion polymerization. These microparticles exhibit narrow size distributions and can be surface-modified to introduce reactive groups for chemical conjugation. Their unique properties?such as high stability, biocompatibility, and ease of functionalization?make them highly suitable for applications in diagnostics, biomedical research, and industrial processes. They are widely used as carriers for antibodies and other biomolecules in immunoassays, as calibration particles in flow cytometry, and as components in advanced material composites. The ability to control particle size and surface chemistry allows manufacturers to customize microparticles for specific applications, enhancing assay sensitivity or material performance.

The global Polystyrene Latex Microparticle market size was estimated at USD 1035.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
