Abstracts

Polystyrene nanoparticles are submicron spherical polymer particles, usually less than 100 nanometers in diameter, produced via specialized polymerization techniques to ensure uniformity and monodispersity. Due to their extremely small size, these nanoparticles possess high surface area-to-volume ratios, enabling enhanced interaction with biological molecules and surfaces. This makes them valuable in nanomedicine, targeted drug delivery, bioimaging, and as calibration standards in analytical instruments. Surface modification of polystyrene nanoparticles allows conjugation with functional groups, dyes, or biomolecules, facilitating their integration into biosensors, diagnostic assays, and research tools. Their stability, ease of synthesis, and versatility in functionalization contribute to their widespread use in advanced scientific and medical applications.

The global Polystyrene Nanoparticles market size was estimated at USD 634.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
