### Report Overview

Polystyrene (PS) is a synthetic aromatic hydrocarbon polymer made from the monomer styrene. Polystyrene also is made into a foam material, called expanded polystyrene (EPS) or extruded polystyrene (XPS), which is valued for its insulating and cushioning properties.

Polystyrene can be solid or foamed. General-purpose polystyrene is clear, hard, and rather brittle. It is an inexpensive resin per unit weight. It is a rather poor barrier to oxygen and water vapour and has a relatively low melting point. Polystyrene is one of the most widely used plastics, the scale of its production being several million tonnes per year. Polystyrene can be naturally transparent, but can be coloured with colourants. Uses include protective packaging, containers, lids, bottles, trays, tumblers, disposable cutlery and in the making of models. Expanded polystyrene is solid foam or thermoplastic product that has characteristics such as low weight, insulation properties and durability. The thermal qualities of expanded polystyrene improve with its strength (density). EPS has a variety of applications such as for thermal insulation boards in building constructions and packaging products. EPS insulation foam is also used in closed cavity walls, roofs and floor insulation. It is the automatic choice for electronic goods cushioning and packaging. Manufacturers rely heavily on EPS due to its insulation and shock absorption capacity, as well as its ability to prevent or minimize product damage during the transportation of sophisticated equipment.

The Global Polystyrene PS and Expanded Polystyrene EPS Market Size was estimated at USD 34668.09 million in 2021 and is projected to reach USD 48781.48 million by

2028, exhibiting a CAGR of 5.00% during the forecast period.
