Abstracts

Polytetramethylene Succinate (PTMS), a biodegradable aliphatic polyester, is synthesized through the polycondensation of succinic acid and 1,4-butanediol, offering a sustainable alternative to conventional petroleum-based plastics due to its compostability and favorable mechanical properties. Its biodegradability under both industrial composting and certain natural conditions positions it as an environmentally friendly material, particularly suitable for applications such as packaging, agricultural films, disposable tableware, and textiles, where end-of-life disposal and ecological impact are significant concerns. The material's balanced characteristics—including good tensile strength, flexibility, and processability—make it adaptable to various manufacturing techniques like injection molding, extrusion, and blow molding, further broadening its utility across multiple sectors. As regulatory pressures and consumer demand for sustainable products intensify, PTMS is gaining attention as part of the broader shift toward bio-based and compostable polymers, though its market penetration is influenced by factors such as production costs, scalability of bio-based feedstocks, and competition with other biodegradable polymers like polylactic acid (PLA) and polybutylene adipate terephthalate (PBAT).

The global Polytetramethylene Succinate market size was estimated at USD 1250.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
