## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyurethane Catalyst A-1 competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyurethane Catalyst A-1 is a highly efficient tertiary amine blowing catalyst based on bis(2-dimethylaminoethyl) ether (BDMAEE). It primarily accelerates the reaction between isocyanates and water, governing gas generation and foam rise behavior in polyurethane formulations. A-1 provides strong blowing activity, supports uniform cell formation, and helps balance rise profile and final foam density. It is supplied either as neat BDMAEE or as formulated solutions in carriers such as dipropylene glycol. The catalyst is widely used in flexible foams, rigid foams, spray systems, elastomers, and various CASE polyurethane applications. In 2024, global production of polyurethane catalyst A-1 reached 41.8 k tons, with an average selling price of US\$7,416 per ton. A typical single-line production capacity is approximately 3,000 tons, and the industry's gross profit margin is approximately 20%-30%. Cost structure: direct materials account for approximately 70%, manufacturing costs account for approximately 20%, and labor costs account for approximately 10%. Industry chain: amine intermediates such as dimethylaminoethanol and etherifying agents; downstream industries include polyurethane foam, elastomers, and adhesives manufacturers.

The global Polyurethane Catalyst A-1 market size was estimated at USD 310.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
