## Abstracts

Polyurethane thermoplastic elastomer is a (AB)<sub>n</sub> type block linear polymer, where A is a high molecular weight (1000~6000) polyester or polyether, B is a glycol containing 2~12 linear carbon atoms, AB<sub>n</sub>. The chemical structure between the segments is diisocyanate. This elastomer is cross-linked through intermolecular hydrogen bonds or light cross-linking between macromolecular chains. As the temperature increases or decreases, these two cross-linked structures are reversible. In the molten state or solution state, the intermolecular forces weaken, but after cooling or the solvent evaporates, strong intermolecular forces connect them together to restore the original solid properties.

The global Polyurethane Thermoplastic Elastomer market size was estimated at USD 38510.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
