## Abstracts

A polyurethane vertebrae bend restrictor is a device used to protect flexible pipelines such as submarine cables from excessive bending or kinking damage under static loads during installation and operation. Its function is to ensure that the bending radius of the cables remains within a safe range, preventing internal structural damage caused by over - bending and guaranteeing the stable operation of relevant facilities. In terms of characteristics, it is made of polyurethane material, featuring high elasticity and flexibility to adapt to various complex bending conditions and effectively buffer stress. It also has excellent wear resistance, making it less prone to self - abrasion, good corrosion resistance with resistance to various chemicals, strong weatherability to adapt to different climatic conditions, and can precisely limit the bending radius, tightly wrapping the cables to provide all - around protection. Technically, it must have the ability to strictly limit the bending radius of the cables. It usually adopts a modular interlocking design, mechanically restricting the bending radius of the submarine cable. The modular units are tightly connected and locked together under external loads to form a stable locking radius, which is generally equal to or greater than the minimum bending radius of the cable. Moreover, it needs to be custom - designed according to the specifications, length of the cable and the actual requirements of the operating environment to ensure flexible and convenient installation.
